RESEARCH MEMORANDUM

TABULATED PRESSURE COEFFICIENTS AND AERODYNAMIC CHARACTERISTICS MEASURED ON THE WING OF THE BELL X-1 AIRPLANE IN AN UNACCELERATED LOW-SPEED STALL, IN PUSH-OVERS AT MACH NUMBERS OF 0.83 AND 0.99, AND IN A PULL-UP AT A MACH NUMBER OF 1.16

By Ronald J. Knapp

SUMMARY

Tabulated pressure coefficients and aerodynamic characteristics are presented for six spanwise stations on the left wing of the Bell X-1 research airplane. These data were obtained in an unaccelerated low-speed stall, in push-overs at Mach numbers of approximately 0.83 and 0.99, and in a pull-up at a Mach number of approximately 1.16.

INTRODUCTION

Flight tests are being conducted to determine the spanwise and chordwise loading on the wing of the Bell X-1 research airplane throughout the transonic and low-supersonic speed range. The purpose of the present paper is to present the basic low-speed data obtained in an unaccelerated stall, and the data obtained in push-overs at Mach numbers of approximately 0.83 and 0.99 and in a pull-up at a Mach number of approximately 1.16. In order that this data be made available at an early date it is being presented here in tabular form with no analysis. A report presenting an analysis of these data is being prepared. These data supplement the data of references 1, 2, and 3. Reference 4 presents analyzed data for station D (64.4 percent test panel semispan) for the Mach number and normal-force coefficient range of reference 2.

SYMBOLS

M	free-stream Mach number
n	normal load factor
W	airplane weight, pounds
S	wing area, including area projected through fuselage (130 sq ft)
S'	area of test panel outboard of station A (99.4 sq ft)
C_{N_A}	airplane normal-force coefficient $\left(\frac{nW}{qS}\right)$
δ_{a_L}	left aileron angle, degrees
$b/2$	wing semispan (14 ft)
$b'/2$	spanwise distance from station A to wing tip (11.42 ft)
c	local wing chord parallel to plane of symmetry, feet
$\bar{c}$	average chord of test panel, feet (S'/b')
c'	mean aerodynamic chord of the test panel (M.A.C.), feet $\left(\frac{2}{S'}\int_0^{b'/2} c^2 dy'\right)$
x	chordwise distance from leading edge of local chord, feet
y	spanwise distance outboard of airplane center line, feet
y'	spanwise distance outboard of station A, feet
q	free-stream dynamic pressure, pounds per square foot
p_o	free-stream static pressure, pounds per square foot
p	local static pressure, pounds per square foot
p_u	local static pressure on upper surface, pounds per square foot

p_l local static pressure on lower surface, pounds per square foot

P pressure coefficient $\left(\frac{p - p_o}{q}\right)$

P_R resultant pressure coefficient $\left(\frac{p_l - p_u}{q}\right)$

c_n section normal-force coefficient $\left(\int_0^1 P_R \, d\frac{x}{c}\right)$

$c_{m_{c/4}}$ section pitching-moment coefficient about 0.25-local-chord point $\left(\int_0^1 -P_R\left(\frac{x}{c} - 0.25\right) d\frac{x}{c}\right)$

c_m section pitching-moment coefficient about a line perpendicular to longitudinal axis of airplane, passing through 0.25-chord point of mean aerodynamic chord of test panel $\left(\int_0^1 -P_R\left(\frac{x}{c} - \frac{0.40c - 0.15c'}{c}\right) d\frac{x}{c}\right)$

C_N' test panel normal-force coefficient $\left(\int_0^1 c_n \frac{c}{\bar{c}} \, d\frac{2y'}{b'}\right)$

C_B' test panel bending-moment coefficient about station A $\left(\int_0^1 c_n \frac{c}{\bar{c}} \frac{2y'}{b'} \, d\frac{2y'}{b'}\right)$

C_M' test panel pitching-moment coefficient about 0.25 panel mean aerodynamic chord $\left(\frac{\bar{c}}{c'}\int_0^1 c_m \left(\frac{c}{\bar{c}}\right)^2 d\frac{2y'}{b'}\right)$

x_{cp} test panel chordwise center of pressure, percent of c'

y'_{cp} test panel lateral center of pressure, percent of b'/2

DESCRIPTION OF AIRPLANE AND TEST PANEL

The Bell X-1 research airplane used in these tests is shown in figure 1. A three-view drawing of the airplane showing the general over-all dimensions is given as figure 2.

The airplane has a 10-percent-thick wing and incorporates an NACA 65-110 airfoil section with slight modifications. The ordinates of the airfoil section are given in table 1. Over the landing flap, the section is modified rearward of the 0.85-chord point to give a finite trailing-edge thickness; over the ailerons, the cusp is replaced by a straight taper from 0.85 chord to the trailing edge (reference 5). A line passing through the 0.40-chord point of the local chords is perpendicular to the longitudinal axis of the airplane. The wing has an incidence angle with respect to the fuselage axis of 2.5° at the root and 1.5° at the tip, an aspect ratio of 6, and a taper ratio of 0.5. The skin thickness is approximately 0.4 inch at the root and 0.15 inch at the tip. The wing was painted and polished during the tests, but no refined filling or smoothing was attempted.

The test panel considered in these tests is that part of the wing outboard of station A as shown in figure 3(a). Station A is approximately 3 inches outboard of the wing-fuselage juncture and 31 inches outboard of the center line of the airplane.

INSTRUMENTATION

Standard NACA recording instruments were used to obtain airspeed, pressure altitude, normal acceleration, and control positions. Wing-surface pressures were measured by two NACA multiple-recording manometers. All records were synchronized by a common timer.

Free-stream static and dynamic pressures were recorded with a standard high-speed Kollsman pitot-static head located ahead of the fuselage nose. The static vents were located at a distance of 0.6 maximum fuselage diameters ahead of the fuselage nose.

Wing-surface pressures were measured from flush-type orifices installed in the wing skin. The spanwise and chordwise locations of the orifices are shown in figure 3. The orifices were connected to the instrument compartment by $\frac{1}{8}$-inch inside-diameter aluminum tubing. The length of aluminum tubing varied from about 2 feet at the root

station to about 14 feet at the tip station. The aluminum tubing was connected to the manometer cells by $\frac{3}{16}$-inch inside-diameter rubber tubing. Approximately 3 feet of rubber tubing were used on each line.

TESTS

The data presented herein were obtained in a low-speed unaccelerated stall at 17,000 feet altitude, a push-over at a Mach number of approximately 0.83 at 27,000 feet altitude, and a pull-up followed by a push-over at 40,000 feet at Mach numbers of approximately 1.16 and 0.99, respectively. The ailerons were held close to neutral and the rolling velocities were low throughout these tests.

METHODS

The test panel is treated herein as an isolated lifting surface and the coefficients obtained from the pressure distributions are based on the geometric properties of the test panel (fig. 3(a)).

The pressure differential between the upper and lower surface was measured at stations A, B, C, E, and F (fig. 3(a)). At station D, individual surface pressures were measured relative to instrument compartment pressure. Static pressure at the pitot-static head was also measured relative to compartment pressure. The measured static pressure was corrected to free-stream static pressure by use of the radar-tracking method of reference 6.

Previous ground tests indicated that lag present in measuring wing-surface pressures was negligible. The effects of lag therefore have been neglected in these data.

In a few instances, the manometer cells did not have sufficient range to measure all pressures encountered. Wherever possible, values were estimated by extrapolating the film trace and by interpolating between the time histories of values from surrounding orifices.

Section coefficients were obtained by mechanical integration of the chordwise pressure distributions. Panel coefficients were obtained by the mechanical integration of the spanwise load distributions.

ACCURACY

Estimations based on the recording pressure instruments and methods of calibration indicate that the accuracies of the reported quantities are as follows:

Mach number	±0.01
P	±0.02

The accuracy of the integrated quantities, based on the accuracies of the pressure recorders, integrative methods, and the coverage of the test data is estimated to be:

c_n	±0.05
$c_{m_{c/4}}$	±0.006

Where it was possible to estimate closely values of pressure that were greater than the cell range, values are presented, but the accuracies given here do not apply to these estimates.

PRESENTATION OF RESULTS

Table 2 presents the measured pressure coefficients and aerodynamic characteristics obtained in a low-speed unaccelerated stall. Tables 3 and 4 present similar data for push-overs at Mach numbers of approximately 0.83 and 0.99. Table 5 presents similar data for a pull-up at a Mach number of approximately 1.16.

All estimates of off-scale pressure coefficients have been noted in the data tables. For cases where estimation of off-scale values was not feasible, no value has been given.
